INTRODUCTION

Control Solutions and Services (CSS) is a part of GE Vernova. With over 40 years of digital controls experience, certified instructors with +20 years of field and instructing experience, CSS has been helping customers develop their field teams to operate and maintain their assets in line with world-class standards. Training is focused on developing operators, control engineers and instrumentation technicians' skills and giving them enough practice before dealing with actual machines and plants. Control Solutions and Services has developed all sorts of simulation software applicable for all types of applications for GE Vernova and non-GE Vernova equipment. This rich library has earned the CSS training special recognitions by customers for being relevant to customer's installed base. GE Vernova has recently developed a skills development program to develop control-room operators and control systems engineers. This program covers basic topics such as instrumentation and networking and builds on that to teach more complex topics related to controls logic and system troubleshooting.

CSS offerings cover the following applications:

1. Unit control applications for both gas turbines and steam turbines on platforms ranging from Mark V, Mark VI and Mark VIeS. This training can be provided for GE Vernova and Non-GE Vernova units equipped with a GE Vernova control system.
2. Electrical control training:
 - a. Excitation control application using EX2100 and EX2100e
 - b. Static starter application (LCI) using LS2100e
 - c. Generator protection panel (GPP)
3. Plant control (for power generation) using distributed control system (DCS)
4. Compressor control training (ITCC)
5. HMI software training
 - a. Cimplicity HMI
 - b. Historian HMI
6. Operators training including:
 - a. Heavy duty gas turbine
 - b. Steam turbine
 - c. GE Vernova LM aero-derivative gas turbine
 - d. Balance of plant (BOP)
7. Network management and OTArmor Cybersecurity
8. Woodward operation and maintenance courses

Training is not one time, one class, one subject matter, but rather a continuous path of learning for plant personnel to gain the knowledge needed to achieve success in running an efficient, well-operated and well-maintained plant. Our instructors, training options, and learning paths will help you achieve these goals.

TRAINING TECHNICAL LEVELS

Training courses have been built to address different technical levels

Operations

Maintenance

Engineering

- Operators technical training
- Instrumentation and control maintenance training
- Engineering training

1. Operators Technical Training

Courses offered to enhance operators' competence which directly reflects on plant availability and reliability. Several courses are offered to operators at different levels for different applications.

- DCS/BOP operations using Mark Mark VL/e / CSS
- CC (combined Cycle) CC DCS operations
- Gas/steam turbine using Mark VI/e/S control system
- Compressor operations
- Historian and HMI operation
- Excitation control and generator protection
- Gas/steam turbine operation fundamentals

2. Instrumentation and Control Maintenance Training

These courses offer in depth knowledge of different plant control and measurement systems. With strong focus on troubleshooting and maintenance techniques, these courses are excellent fit for instrumentation, maintenance and control professionals.

- Mark VI/e/S control systems
- EX2100/e excitation control system
- Generator protection panel
- Compressor control
- SC/BOP DCS controls
- CC (combined Cycle) CC DCS advanced controls
- Industrial networks and OTArmor Cybersecurity

3. Engineering Advanced Training

These courses offer in depth knowledge of different plant control and measurement systems. With strong focus on engineering techniques, these courses are excellent fit for control professionals.

- Mark VI/e/S control systems
- EX2100/e excitation control system
- Generator protection panel
- Compressor control
- SC/BOP DCS controls
- CC (combined Cycle) CC DCS advanced controls
- Industrial networks and cyber security

TRAINING DELIVERY OPTIONS

1. FAT Validated Site-Specific Classes

Those are tailored courses specifically to your site, which can be held either at your site or at one of the GE Vernova facilities where, site-specific material and software is used during training course.

The site-specific offerings provide the students with comprehensive training of their GE Vernova equipment upgrade which involves all the modifications and improvements that have been captured over the life of the plant. The training provides the student with an overview of systems and major components using the site-specific manuals, configurations, drawings, software (when available), and utilizing simulations. The simulation used for these classes are usually the simulation software that is used during Factory Acceptance Test (FAT) which brings the exact screens, logic and process maps to the classroom. This has proven to be the most effective tool to help field personnel deal with their new installation with confidence.

After training, the students are able to locate those same components in the plant with a thorough understanding of each system, major components, and how the system operates, enabling successful operation and maintenance of the plant.

2. Remote Live Instructor Classes

Remote training service connects your staff with our industry leading instructors without the need for expensive travel. Gain remote access to our virtual classroom in our instructor led skill development courses.

GE Vernova is offering a new remote training option for customers who are seeking to improve their field personnel skills in a challenging business environment. This remote training solution is most suitable for customers:

1. With employees at restricted-access sites
(e.g. employees in lockdown situation like the COVID-19 or in extreme remote locations)
2. With strict budget limitation on travel and living expenses
3. With employees seeking to gain credit towards professional development for professional licensing

The GE Vernova remote training solution provides a mix of audio, visual and virtual hands-on workshops with remote connectivity and control of training simulations to practice different scenarios with software logic and troubleshooting exercises (kindly review the CSS Remote Flyer at the end of this documents).

3. Open Enrollment Classes

Open enrollment courses are generic in content, which are conducted at one of GE Vernova facilities worldwide. The courses have been designed to help customers maintain a work force skilled in controls, operations, and maintenance. In addition to offering the same high-quality training as our site-specific courses, the open enrollment courses offer the opportunity to train with students from around the world. They also offer a cost-effective training alternative for customers with small staffs or new team members.

Courses are conducted during normal business hours for the region, with no evening sessions. Course size is limited to maintain a successful learning environment and to allow sufficient time for the hands-on portion of the training. Lectures and supporting technical manuals are presented in English, French or Spanish. Please, check our Website for further details on open courses (<https://controlsolutionstraining.com/>)

4. Informal Onsite Coaching

- We bring the coaching program to your site with our standard 2-day informal training option
- Product specific overview presentations with Q&A with a certified FSE
- Use of as-installed equipment at customer site

GE VERNOVA'S CONTROLS SKILLS DEVELOPMENT PROGRAMS (SDP)

GE Vernova works with you to develop a comprehensive skills development program specifically designed to address your needs. A comprehensive Skills Development program will help accelerate the technical competence of your staff and maximize your ROI on training investments.

The **first step** in our skill development program is establishing a role-based competency matrix. This will be achieved by combining your organization's job descriptions and our GE Vernova Learning Paths. All the delegates will be assessed against competency matrix specific to their role to identify skills and competency gaps. Based on the **skill gaps identified**, Control Systems deployed at site and site operational constraints a **roadmap** to build sustainable competencies will be developed.

By using **customized training** content and state of art training aids our certified instructors will conduct learner- centered training sessions at your site. Later, employees will work on pre-defined **on-job training** opportunities under the **mentorship** of our subject matter experts to acquire valuable practical skills and build confidence in facing key challenges in your facility.

FAST-TRACK TO EXCELLENCE

Customized training program (based on customer job description and existing installed base) providing a mix between theoretical and practical sessions. With this formula for accelerated-learning, our clients are able to achieve world-class certification of their personnel and enjoy the highest ROI on their training budgets.

TRAINING TOOLS

Mark VIe Portable Training Kit

The Mark VIe portable trainer includes:

- 1 UCSA/B/C/E processor board
- 1 PDIO pack mounted on TDBS + WROB terminal board for discrete I/O
- 1 PAIC pack mounted on STAI terminal board for analog I/O
- 1 power supply
- 1 network switch for IONet and external communications
- 4 on/off toggle switches to mimic digital inputs
- 4 lights for analog output simulation
- 1 potentiometer for analog input simulation
- 1 analog\RTD meter for analog output\RTD value display
- 1 PRTD pack mounted on SRTD terminal board for RTDs

Portable kit would help trainees to:

- Communicate with Mark VIe controller
- Troubleshoot and communicate with Mark VIe IO modules
- Terminate different IOs to Mark VIe TBs
- Download software and normalize IOPacks
- Hardware components online/offline replacement
- Simulation of different IO combinations
- Software provided with the kit will be full simulation enabled which allows trainees to connect to kit and simulate full real-case scenario as unit start/shutdown/trip etc.

FAT Validated Simulation

FAT Validated simulation brings customer approved software to the classroom. Trainees will perform labs and troubleshooting exercises on their site-specific application software and graphics software packages installed and functional. This provides familiarity with the new platform and in many cases helps simulate actual problems onsite.

This shall allow trainees to get full simulation capabilities with respect to unit startup, shutdown and trip simulation as well. Along with that, there shall be pre-configured labs for most of training sessions that will be conducted under supervision of instructor.

Upon request, site-specific software and graphics could be provided along with simulation laptop however, this shall be highlighted during early training discussion.

Mark VIe TMR Typical Panel

Typical Panel help trainees to:

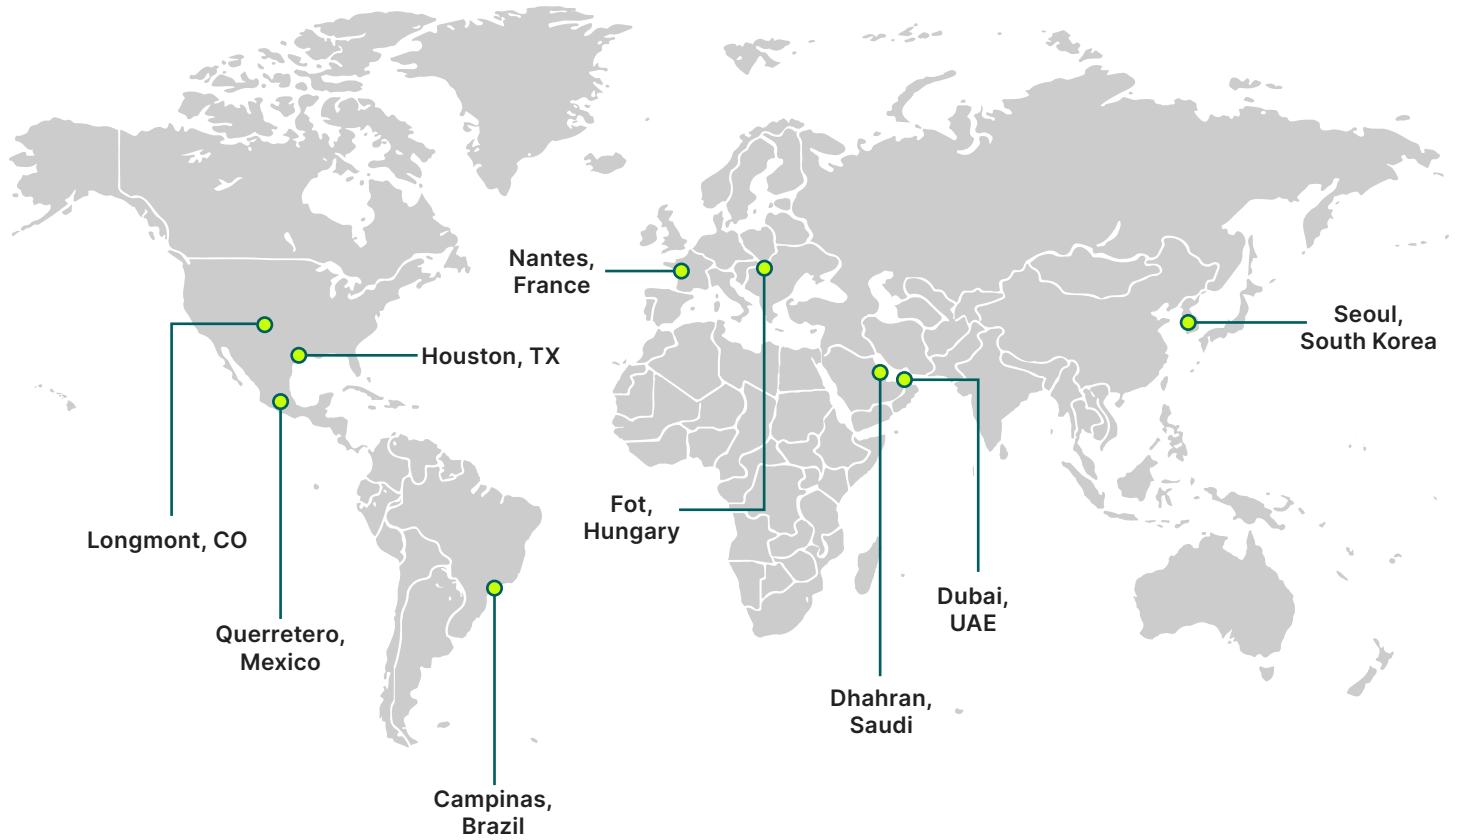

- Communicate with Redundant Mark VIe controller
- Redundancy Test
- Same experience as if you are working on actual onsite Panel
- Troubleshoot and communicate with Mark VIe IO modules
- Terminate different IOs to Mark VIe TBs
- Download software and normalize IOPacks
- Hardware components online/offline replacement
- Simulation of different IO combinations
- Software provided with the kit will be full simulation enabled which allows trainees to connect to kit and simulate full real-case scenario as unit start/shutdown/trip etc.

EX2100e Training Tools

For electrical sessions, standalone controller and network switch will be provided as training supporting tool along with simulation laptops.

TRAINING LOCATIONS

CEU credits

Our Training Program supports continuing education units (CEU) or continuing education credit (CEC) used in continuing education programs to assist professionals in maintaining license in their profession. Please indicate the request for this credit to your instructor so we can coordinate the appropriate evaluation and signoff for this continuing education program.

CONTROL COURSES - MK VI

Mark VI Modular Trainings

MKVI maintenance course

(5 days)

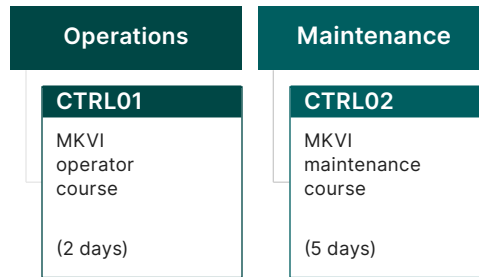

CTRL01 Mark VI Operator Course

Course Description

This course is intended to familiarize operations team with MKVI and HMI main components.

Course code	CTRL01
Target audience	Operations
Duration (days)	2
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	Training laptops with Site Specific simulated software and graphics

Course Content and Agenda

Day 1	Day 2
System overview and architecture	Cimplicity alarm viewer basics
Instructor background	Cimplicity screens review
Course outline	Cimplicity startup and navigation
Mark VI system overview	Cimplicity trends
Equipment walk down	

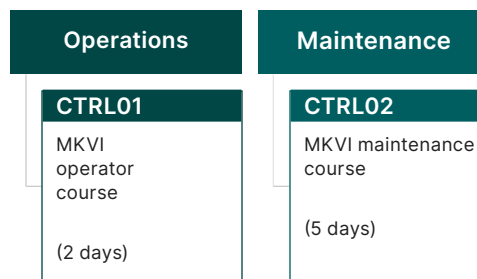

CTRL02 Mark VI Maintenance Course

Course Description

This program is intended for all control technicians and engineers of existing, installed turbines (steam or gas) on which Mark VI control system has been installed. It is expected that the technicians will have hands-on experience with their turbine systems. This training will familiarize them with any hardware upgrades on the turbine in association with the upgraded control package, the hardware and software components of the control system providing the knowledge to work with the Mark VI control system in application with their turbine. It will develop skills in process alarm troubleshooting and analysis of the control code.

This course will cover:

- Troubleshooting techniques
- GE Vernova ToolBox software
- Block functionality and use of help files
- How to trend signals within the application
- Watch window tool
- Troubleshooting CIMPLICITY screens
- CIMPLICITY (HMI) software and navigation of site screens
- Configure, monitor, and force various I/O types
- Navigation of site application using finder
- How to adjust and force signals
- How to read and troubleshoot alarms
- How to locate and read documents

Course code	CTRL02
Target audience	Maintenance
Duration (days)	5
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	Training laptops with Site Specific simulated software and graphics

Course Content and Agenda

Day 1	Day 2	Day 3	Day 4	Day 5
Introduction A. Instructor background B. Course outline Equipment Review A. MK VI system overview B. ToolBox structure C. MK VI I/O pack controls D. PDM E. Monitoring software	Toolbox tools Finder Watch windows Constants and variables Trenders View and troubleshoot IO diagnostic alarms	Maintenance Control cards and terminal board replacement Controller card replacement Permanent software changes Configuring IO points LVDT calibration	HMI CIMPLICITY (basic) A. UDH-networking B. Introduction to EGD C. Cimplicity Single screen troubleshooting D. Cimplicity communications E. Compiling and downloading	Troubleshooting A. Alarm tracing B. Add and modify alarms C. Viewing TripLog D. Capture blocks E. Trip history F. Course closure Q&A and session recap

<ul style="list-style-type: none"> • System overview and architecture • Course outline • Equipment review: <ul style="list-style-type: none"> – Upgraded MarkVIe system overview and drawings – Major changes in hardware and software • Upgraded FAT ToolboxST structure • WorkstationST customer-specific alarm tracing to FAT software • Upgraded FAT Cimplicity screens review • Upgraded FAT Cimplicity startup and navigation • Upgraded FAT Cimplicity trends • Historian PI (If applicable) • Upgraded Equipment walk down 	<ul style="list-style-type: none"> • Upgraded Cimplicity Screens Modifications review. • All modifications reviews relating Logic to Screens with labs based on these changes from previous SW to new FAT SW • FAT Software simulated non-standard startup sequence including: <ul style="list-style-type: none"> – Preparation for line-up (valves, BOP, Electrical and auxiliary systems) – Auxiliary systems pre-startup checks – Trip setpoints – Watch windows customization – Forcing signals – Alarms • Upgraded/As-running Trends workshops • Upgraded startup, shutdown and other operating modes including FSNL, loading and synchronization

CTRL04 Mark VIe/S Upgrade/Retrofit Intermediate Maintenance Course

Course Description

This program is intended for all control technicians and engineers of existing, installed turbines (steam or gas) BOP on which a new Mark VIe control system has been or to be installed. It is expected that the technicians will have hands-on experience with their turbine systems. This training will familiarize them with any hardware upgrades on the turbine in association with the upgraded control package, the hardware and software components of the control system providing the knowledge to work with the Mark VIe control system in application with their system. It will develop skills in process alarm troubleshooting and analysis of the control code. Depending on time opportunities there may be limited discussion on subjects such as LVDT calibration, Cimplicity software programming, sequence editing or diagnostic alarm troubleshooting. These topics will be agreed upon based on discussions with the instructor and the attendees.

For private classes, the GE Vernova instructor will utilize Site-Specific Approved (FAT validated) simulation software for all class workshops and labs.

This course will provide basic knowledge on the following:

- Gain the skills and confidence to perform system maintenance
- Learn and document the processes to complete control system maintenance duties
- Save time when troubleshooting the system and minimize system down time
- Gain an intermediate knowledge of the software tools
- Use the software tools for troubleshooting and understanding the system
- Apply intermediate knowledge of the software tools to make site specific improvements

CTRL05 Mark VIe/S Upgrade/Retrofit Advanced Maintenance Course

Course Description

This program is intended for experienced control technicians and engineers of existing turbines (steam or gas) or BOP on which a new Mark VIe control system has been or to be installed. It is expected that the technicians will have hands-on experience with their turbine systems. This training will build upon the basic knowledge of the MarkVIe gained through the previous level courses to increase their capabilities in handling the hardware and software components of their MarkVIe control system. This will be enhanced by advanced topic discussions related to the Mark VIe control system in application with their system. It will advance their skills in process alarm troubleshooting and analysis of the control code. Depending on time there may be limited discussion on subjects such as LVDT calibration, Cimplicity software programming, screen editing or diagnostic alarm troubleshooting. These topics will be agreed upon based on discussions with the instructor and the attendees.

For private classes, the GE Vernova instructor will utilize Site-Specific Approved (FAT validated) simulation software for all class workshops and labs.

This course will provide basic knowledge on the following:

- Control system configuration
- Alarm troubleshooting and adjustments
- Cimplicity screen modification
- Hardware I/O configuration
- Valve Calibration
- Apply advanced knowledge of the software tools to make site specific improvements
- Prerequisite of CTRL04

CTRL06 Mark VIe Control Migration from Mark V Course

Course Description

This training will familiarize students with the hardware and software components of the control system, changes to the HMI and the overall control system architecture. It will develop strong skills in process alarm troubleshooting and analysis of the control code. Additional training includes LVDT calibration, control interface (Cimplicity HMI) software programming, sequence editing, diagnostic alarm troubleshooting and advanced data collection techniques.

Please note: The training equipment (trainer) will not run the site software. It will operate on generic, machine-compatible software (i.e. if the site training is for a steam turbine, the trainer will operate using a 'generic' steam turbine). If the site software is available at the time of the training, it will be used to illustrate various aspects of the training material, but it will not be loaded on the trainer.

CTRL07 Mark VI to Mark VIe Platform Upgrade Maintenance

Course Description

This program is intended for personnel whose site has a Mark VIe control migration from Mark VI control system. The training will familiarize students with the hardware and software components and provide detailed knowledge to troubleshoot and maintain the control system and associated equipment.

The course is modular and includes training material derived from actual Mark VIe control migration from Mark VI control installed systems. Training is delivered in short lessons followed by labs. The hands-on labs are performed on an HMI computer specially programmed to simulate a turbine. The labs are progressively challenging and assist the students to learn the basics and build up to intermediate skills including alarm and system troubleshooting. **Please note:** This course is instructed with a generic gas turbine control simulation appropriate for training. If available, the site software will be presented in demonstrations.

This course will provide knowledge on the following:

- Learn and document the processes to complete control system maintenance duties
- Save time when troubleshooting and minimize system down time
- Gain a fundamental knowledge of the software tools
- Use the software tools for troubleshooting and understanding the system

	LCI02 LS2100e LCI for turbine static start (3 days)	GPP01 Generator protection (GPP) (4 days)
	EX02 Excitation EX2100e maintenance (5 days)	

EX01 - Excitation - EX2100e Generator Operation

Course Description

The course is designed for operations personnel who operate a generator with an EX2100e generator excitation system. The course focuses on safe generator operation and fundamentals supporting the safe and hands-on operation with a portable simulator.

Training is performed with lectures and demonstrations using an EX2100e simulator. An EX2100e simulator and operator station will be available as well as site-specific software for discussion. Site specific documentation and training manuals provided to the students will be used in the training.

This course will provide basic knowledge on the following:

- Safe off-line and on-line operation of the generator
- How to identify limiter indications
- How to read alarm and fault messages

LCI01 - LS2100 LCI for Turbine Static Start

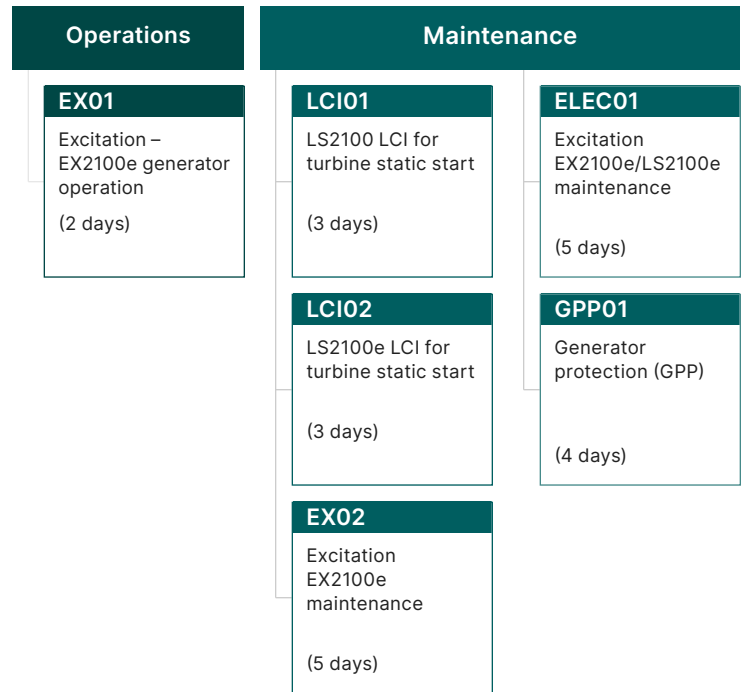

Course Description

This course is designed for engineering and maintenance personnel who configure and maintain the LCI static starter. Laboratory assignments include hardware identification and Control system ToolBoxST™ communications, understanding the monitor commands. This course will utilize a single simulator. Lectures and hands-on exercises are used to maximize student material retention.

This course will provide basic knowledge on the following:

- Describe how the LS2100 changes the speed of the generator/motor
- Perform maintenance on the pump panel
- LSB file use with the control system ToolBoxST™
- Troubleshoot the connectivity between the LS2100, the turbine control, and the exciter

Course code	LCI01
Target audience	Maintenance
Duration (days)	3
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	Training laptops with Site Specific simulated software and graphics

<p>Static starter theory and major components</p> <p>Elementary diagram reading</p> <p>Pump panel operations maintenance and troubleshooting</p> <p>Loading software programs</p> <p>Control system ToolBoxST™ familiarization</p>	<p>Trend recording with capture buffer for troubleshooting</p> <p>Controller functions</p> <p>Real-time recording</p>	<p>Alarm messages</p> <p>Scaling feedback signals, and nulling offsets</p> <p>Troubleshooting faults and alarms</p> <p>Q&A and wrap-up</p>

LCI02 - LS2100e LCI for Turbine Static Start

Course Description

This course is designed for engineering and maintenance personnel who configure and maintain the LCI static starter. Laboratory assignments include hardware identification, control system ToolBoxST™ communications, and user diagnostic tests. This course will utilize simulators, and a walk through (if available) of your full functioning LCI starter. Lectures and hands-on exercises develop a thorough understanding of the equipment.

This course will provide basic knowledge on the following:

- Describe what the LS2100e is used for
- Describe how the LS2100e changes the speed of the generator/motor
- Perform maintenance on the pump panel
- Develop a thorough understanding of the .tcw file used in the ControlST™ tools
- Understand and troubleshoot the connectivity between the LS2100e and the turbine control.

EX02 - Excitation EX2100e Maintenance

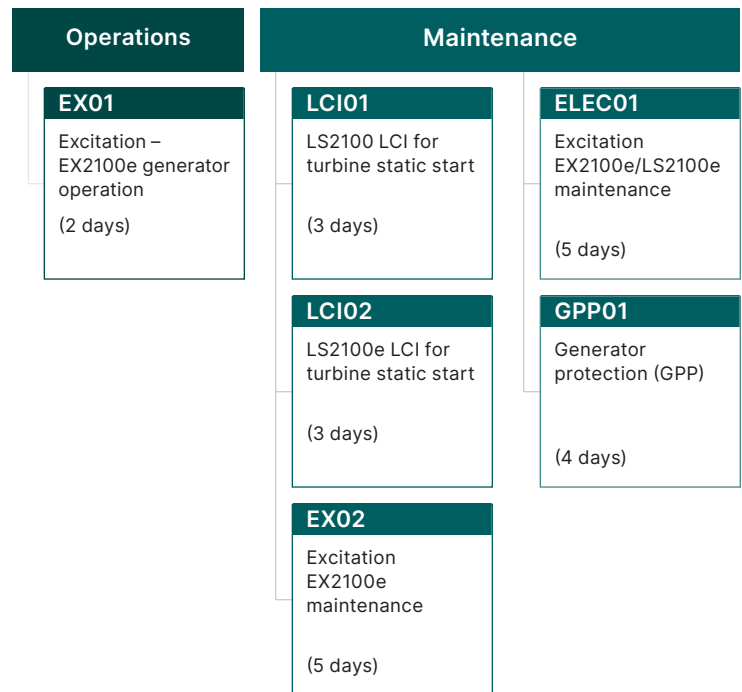

Course Description

The EX2100e course is an advanced level training course covering EX2100e and control systems toolbox. These systems are common to gas and steam turbine generators up to 1500 M watts. The classroom presentation will cover: the function, calibration of the standard excitation modules, auxiliary equipment, software tools and some options for each excitation system.

At the completion of the training, the participants should be able to:

- Describe the function and operation
- Perform basic startup checks
- Perform basic trouble shooting techniques on: generators, excitation systems and Solid-state power conversion modules an operating power plant
- Startup, calibrate, and trouble shoot to the component level the EX2100e generator excitation systems

ELEC01 - Excitation EX2100e/LS2100e Maintenance

Course Description

This course covers generator operation, excitation, LCI and the functions of the generator protection panel. The course is taught using site drawings and system settings.

The course is designed to stress the safe operation of the generator as well as enhance the student's background in maintenance and troubleshooting skills on the EX2100e and LS2100e.

Course code	ELEC01

GPP01 - Generator Protection (GPP)

Course Description

Generator protection (GPP) is intended for electrical maintenance team to get familiarization with GE Vernova UR family of relays. It covers both hardware and software parts.

Course has been built for those involved in protecting power plant and Utility power systems who require an understanding of the principles of protective relaying specially site, maintenance and field engineers who will be installing and commissioning GE Vernova UR relays will benefit from this course. Students range from recent graduates entering the field of operations and maintenance staff to seasoned professionals who require an update on the latest technology.

Site specific software need to be shared before training.

Prerequisites

- Basic understanding of electrical circuits
- Microsoft Windows knowledge
- Attendees / students to bring a laptop computer to realize the practical exercises

Course code	GPP01

GT01 - Gas Turbine - Operations - Field Operator Course

Course Description

This site-specific course is designed to enable, supervisors, outside operations to operate GE Vernova designed heavy-duty gas turbine generator units. The course focus on instrumentation and system functions from the perspective of an outside operator who walks down the unit. No training laptops/simulation (ML and GEK numbers are based on 7FA.05).

If the course is held at the customer's location it will include site visits to familiarize personnel with the physical layout of the gas turbine, and the location of the various system components, and provide personnel the opportunity to correlate the system piping schematics to the respective system hardware.

Course code	GT01
Target audience	Operations

GT02 - Gas Turbine - Operation Course - Control Room Operator

Course Description

This site-specific course is designed to enable, supervisors, operations, and maintenance personnel to operate GE Vernova designed heavy-duty gas turbine generator units. The course develops a background in gas turbine generator support systems, and operations, which will enable participants to analyze operating problems and take the necessary corrective action. It will also detail the design and construction of the gas turbine generator. Emphasis is placed on the detailed description of the gas turbine - generator major components, the functions of their auxiliary systems, and the operator's responsibilities with regard to systems operations, and operational data acquisition, and evaluation of anomalies through the use of classroom instruction, class exercises, and use of a turbine - generator trainer. If the course is held at the customer's location it will include site visits to familiarize personnel with the physical layout of the gas turbine - generator, and the location of the various system components, and provide personnel the opportunity to correlate the system piping schematics to the respective system hardware. Operators are instructed in how to interpret fault annunciation and how to determine if the annunciated fault can be remedied by operator action or with the assistance of instrumentation and/or maintenance personnel. The course focuses on the starting, loading, and specific operator checks of the various turbine support and auxiliary systems to ensure reliable operation of the gas turbine - generator unit, and the effect that operation has on major mechanical maintenance.

GT03 - Mark VI/e Gas Turbine Control System Operation and Maintenance

Course Description

This program is intended for all control technicians and engineers. The training will offer the attendees in-depth knowledge to work with the MK VI/e control system in application with the gas turbine. This training will familiarize them with the hardware and software components of the control system. It will develop strong skills in process alarm troubleshooting and analysis of the control code. Additional training includes LVDT calibration, control interface (Cimplicity HMI) software programming, sequence editing and diagnostic alarm troubleshooting.

Please note: The training equipment (trainer) will not run the site software. It will operate on Site Specific, machine-compatible software (i.e. if the site training is for a steam

turbine, the trainer will operate using a Course content and agenda 'generic' steam turbine). If the site software is available at the time of the training, it will be used to illustrate various aspects of the training material, but it will not be loaded on the trainer.

AER01 - MK Vle-GE Vernova LM Aeroderivative Maintenance and Troubleshooting

Course Description

This program is intended for all control technicians and engineers, it introduces LM maintenance and alarm troubleshooting procedures of the Mark Vle control system. This course will also cover functional sensor and actuator description, troubleshooting, and a summary of calibration and inspections required for major turbine package.

The course designed primarily for LMS100, LM6000 Mark Vle applications. The course material and exercises provide training on hardware, network interfaces and software tools which are used to troubleshoot alarms, edit the control logic, configure the inputs and outputs (both hardwired and networked), and calibrate Servo-actuated valve LVDT's and other devices. It covers also, ToolBoxST, WorkstationST and Cimplicity/HMI. The course DOES NOT include repair procedures for gas turbine components.

Please note: The training equipment (trainer) will not run the site software. It will operate on generic, machine compatible software (i.e. if the site training is for a steam turbine, the trainer will operate using a 'generic' steam turbine). If the site software is available at the time of the training, it will be used to illustrate various aspects of the training material but it will not be loaded on the trainer.

ST01 - Steam Turbine - Operation Course

Course Description

This site-specific course is designed to enable, supervisors, operations, and maintenance personnel to operate heavy duty steam turbine generator units. The course develops a background in steam turbine generator support systems, and operations, which will enable participants to analyze operating problems and take the necessary corrective action. It will also detail the design and construction of the ST GEN. Emphasis is placed on the detailed description of ST GEN major components, the functions of their auxiliary systems, and the operator's responsibilities with regard to systems operations, and operational data acquisition, and evaluation of anomalies through the use of classroom instruction, class exercises, If the course is held at the customer's location it will include site visits to familiarize personnel with the physical layout of ST GEN and the location of the various system.

CCS02 - Mark Vle with Integrated Turbine and Compressor Controls (ITCC) Maintenance

Course Description

This program is intended for personnel whose site has a Mark Vle control with ITCC.

The training will familiarize students with the hardware and software components and provide fundamental knowledge to troubleshoot and maintain the associated equipment.

The course is modular and includes training material derived from actual installed Mark Vle control systems. Training is performed with short lessons followed by labs. The hands-on labs are performed on an HMI computer specially programmed to simulate a turbine-compressor set. The labs are progressively challenging and assist the students in learning the basic skills including alarm and system troubleshooting.

This course will provide basic knowledge on the following:

- Understand the hardware architecture of the Mark Vle control
- Become familiar with the software applications used for monitoring and configuring the Mark Vle control
- Use the tools available to maintain the turbine-compressor set and the control system itself
- Learn the techniques for tracing alarm messages to their sources
- Become familiar with the documents, drawings, and publications required to effectively maintain the equipment and how to access them
- Understand the phenomenon of compressor surge
- Learn the fundamentals of the compressor control functions of the controller software

HMI02 - Network Upgrade Introduction Course

Course Description

This course provides fundamental maintenance and troubleshooting skills for typical MK V1e control system maintenance team. It assumes that site network is running WorkStationST (If otherwise, please highlight).

Typical Mark-V1e network composes of multi-layer; UDH (unit data highway), PDH (plant data highway), ADH and others (based on site layout and configurations) in addition to that IONet (I/O network) is also covered within this course. This course covers UDH and PDH networks in details. With advanced Cimplicity fundamentals topics.

Site specific network topology drawing (MLI 4108) will be used as a reference during this course.

SEC01 - Cybersecurity - OTArmor CSMS Introduction

Course Description

OTArmor is the latest release of the GE Vernova Cybersecurity management system (CSMS). This program is designed to introduce students to the latest virtual machines, applications and concepts related to the OTArmor CSMS.

Objectives:

- Combination of technical classroom presentation and hands on workshops.
- Understand basic concepts of cybersecurity and cybersecurity features.
- Enable personnel to perform routine activities including backup and recovery, updates, patch deployment and troubleshooting.
- Perform routine operations on the OTArmor system including how to log in, manage disaster recovery tasks, navigate virtual machines.
- Customization of the daily training plan with expert guidance on creation, content flow and workshops for hands-on learning.

Course code	SEC01
Target audience	IT/OT/maintenance
Duration (days)	3
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	<p>Onsite: using customer Remote Connection to GE Vernova's OTArmor servers through Cloud share OTArmor server and HMIs</p> <p>Offsite: using actual training OTArmor server</p>

Course Content and Agenda

Day 1	Day 2	Day 3
Instructor/s and student backgrounds Cybersecurity awareness Introduction to OTArmor CSMS	Virtual hosts Virtual machines Disaster recovery system	Patch management Site protection

SEC02 - Cybersecurity - OTArmor CSMS Intermediate

Course Description

OTArmor is the latest release of the GE Vernova Cybersecurity management system (CSMS). This program is designed to introduce students to more advanced operations tasks related to the latest virtual machines, applications and concepts related to the OTArmor CSMS.

Objectives:

- Combination of technical classroom presentation and hands-on workshops.
- Understand and demonstrate basic and advanced functions of cybersecurity using the OTArmor CSMS product.
- Enable personnel to perform monthly patching activities including updates, patch deployment and troubleshooting.
- Perform routine operations on the OTArmor CSMS system including how to log in, manage disaster recovery tasks, navigate virtual machines.
- Customization of the daily training plan with expert guidance on creation, content flow and workshops for hands-on learning.
- Includes simulators, customer software, and laptop equipment labs and simulation.

Program and Content:

The program is a five day, interactive training program giving students the ability to learn and demonstrate key skills required to effectively manage their cyber security system. With core content building the basis for the material, optional content is added based on customer configuration.

Course code	SEC02
Target audience	IT/OT/maintenance
Duration (days)	5
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	Onsite: using customer installed OTArmor server and HMIs Offsite: using actual training OTArmor server

Course Content and Agenda

Topics	Workshops
System overview and architecture CSMS system awareness System overview	Workshop #1: Virtual machine navigation
Virtual Machines Virtual Hosts Virtual Machines	Workshop #2: DC1/DC2 setup and configuration
Domain Controllers	Workshop #3: Domain policies.
Disaster Recovery	Workshop #4: DR1 Workshop
Network Device Configuration Switches Firewalls	Workshop #5: Switch configuration workshop
Whitelisting SP1 AV, Whitelisting, DLP Certificate authority (CA1)	Workshop #6: Certificate Authority CA1
Patch Management SIEM (SPLUNK) Log Management (LM1)	Workshop #7: Patching workshop
Additional Topics (depending on customer installation) McAfee anti-virus and whitelisting Symantec anti-virus Trend micro anti-virus Remote Client and Virtual HIMs (RDS1/2, EWS1, etc) Additional offerings (AM1, SPAX1, etc) Xona	Workshop #8: Log Management workshop

SEC03 - Cybersecurity - OTArmor Advanced

Course Description

This session has combination of technical classroom presentation and hands on workshops.

It's built for generic-industrial cybersecurity knowledge targeting technical (IT/OT) teams.

Course code	SEC03
Target audience	Engineering
Duration (days)	7
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	<p>Onsite: using customer installed OTArmor server and HMIs</p> <p>Offsite: using actual training OTArmor server</p>

Course Content and Agenda

Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7
Introduction to cybersecurity	Basics of computer science (NAT, VLAN, SPI, DP) Basics of power shell scripting	Designing Microsoft active directory group policy objects	Understanding McAfee ePO modules Application control and DLP functionality	Designing firewall policies and introduction to Fortinet CLI Designing splunk dashboards, alerts and reports	Introduction to cybersecurity troubleshooting	Assessment exam Course recap and open Q&A session

WOODWARD COURSES

WW01 Woodward Introduction Training

Course Description

This session will familiarize operator teams with Woodward controls, main components and associated systems and devices.

Learn with on-site equipment.

Course code	WW01
Target audience	Operations
Duration (days)	2
Training location	<ul style="list-style-type: none"> • GE Vernova facility • Customer site • Remote training
Simulation tools and labs	Onsite: using customer installed system

Course Content and Agenda

Day 1	Day 2
<p>System overview and architecture</p> <ul style="list-style-type: none"> • Woodward system overview • Software overview, GAP and control assistant • Wiring and elementary prints and I/O logic • Equipment walk down 	<p>WorkStationST alarm viewer basics</p> <ul style="list-style-type: none"> • System calibration review • Troubleshooting, standard steps and process <p>Optional additional topics:</p> <ul style="list-style-type: none"> • Fanuc or PLC or Quick panel software • Alarm tracing review • Alarm designations and trip screens <p>Methodology:</p> <ul style="list-style-type: none"> • Classroom learning by presentation slides. • Reference of manuals and plant specific documentations. • Equipment walk-down, and question and answer session

GE VERNOVA'S GAS POWER CONTROL SOLUTIONS & SERVICES REMOTE LEARNING FLYER

Live Instructor Led Sessions

REMOTE LEARNING

Remote training service connects your staff with our industry leading instructors without the need for expensive travel. Gain remote access to our virtual classroom in our instructor led skill development courses.

Operation, Maintenance and Unit Control

With years of field experience, GE Vernova trainers have a deep knowledge of product operation, maintenance, and control. Through a secure web connection, instructors and participants collaborate in the same virtual classroom, preserving traditional classroom learning outcomes.

Remote Hands-On Workshop

Remote workshops on daily operations and real case scenarios are conducted on live simulators. Practice is supervised by instructors and virtual class sizes are kept small, ensuring you get the most out of your training experience.

Effective Skill Development

With 14 modules, you will find courses tailored to your team's experience level, whether operators, technicians, or engineers. Our remote training is simple to use, providing you access to technical and operational knowledge, saving you on travel expenses.

controlsolutionstraining.com

Objectives and Benefits

- Improved technical skills to protect and control assets
- Customer specific software and break-fix workshops
- Secure remote connection on hosted training simulators
- Site specific Q&A sessions and coaching
- Develop skills for operators, maintenance, and master technicians
- Reduction in equipment downtime with a well-trained staff

Global expertise delivered locally with secured remote connection

Remote student recommendations: computer with mouse and keyboard, two monitor setup, audio headset, internet connection of 25mbps.
